specialized in **programming languages & compilers**

Waterloo, Ontario, Canada

Objective

I am interested in software safety and efficiency across the entire lifecycle: from **design** (**model checking** and **formal methods**) to **programming** (**program analysis** and **formal verification** via automatic and **interactive theorem proving**) to **compilation** (**type checking**, **optimization**, and **compiler correctness**).

Education

University of Waterloo, Ph.D. in Computer Science	Sep 2021 – present
Supervisors: Yizhou Zhang, Ondřej Lhoták	Cumulative GPA: 96.2/100
Saarland University, Saarbrücken, Germany – Exchange (Grade: 1.3, German Grading Scale)	Sep 2019 – Aug 2020
Institute of Software, Chinese Academy of Sciences, M.Sc. in Computer Science	Sep 2018 – Aug 2021
Nanjing University of Aeronautics and Astronautics, B.Sc. in Computer Science	Sep 2013 – Jun 2018

Experience

Research Assistant (Compiler Projects for Probabilistic Programming), University of Waterloo Sep 2021 – Present

- I design **probabilistic programming languages (PPLs)**, develop their **semantics**, and implement **compilers** with novel compilation strategies tailored to different inference methods (e.g., variational Bayesian inference, variable elimination) and **compilation artifacts**, enabling efficient, reliable, and certified probabilistic programming:
 - **GENI (ICFP 2025)**: A compiler implemented in **Rust** that compiles functional-programming-style probabilistic programs into **generating functions**, a compact and exact compilation target representing measures. Proposed the first **design** and **formalization** of GF compilation for a **functional PPL**; implemented a **live variable analysis** optimization; and demonstrated scalability competitive with **binary decision diagram**-based inference.
 - **MAPPL (PLDI 2024)**: A compiler implemented in **OCaml** that enables scalable inference by factorizing recursive probabilistic programs via **continuation-passing-style (CPS)** compilation and **information-flow typing** (with a denotational, **logical-relations** model). Compilation artifacts recover expert-designed **polynomial-time** algorithms (e.g., the forward algorithm for **HMM**) without human intervention, whereas baselines require **exponential time**.
 - **FIDELIO (POPL 2023)**: A compiler that embodies symbolic methods (e.g., **type system**, **program analysis**) aiding **neural-network**-based inference. Consistently improved training and inference performance over mean-field and **LSTM** baselines. (**PyTorch**, **importance sampling**, **variational inference**, **deep amortized inference**).
- Implemented maximum-entropy **reinforcement learning** via variational inference in **Pyro**, a deep Universal PPL.

Teaching Assistant (tutorials, office hours, grading), University of Waterloo Jan 2022 – Aug 2025

- Computer Architecture, Compiler Construction, Logic and Computation, Foundations of Sequential Programs.

Visiting Researcher, Universität des Saarlandes, Saarbrücken, Germany Sep 2019 – Aug 2020

- Worked on automated safety **verification** of programs invoking **neural networks** (published at **CAV 2021**):
 - Trained a heterogeneous controller combining neural networks and handcrafted components (C programs) via **reinforcement learning** in an **OpenAI** Minigrid-style environment, enabling autonomous decision making.
 - Integrated **CLAM**, a state-of-the-art **LLVM** bitcode static analyzer, with **DEEPSYMBOL** (my neural network verifier), enabling a precise neuro-aware verification pipeline (previously infeasible to verify without our approach).
- Generalized Minsky Machine Halting Problem \preceq_m 2-Counter Machine Halting Problem in **Rocq** (formerly **Coq**).

Research Assistant (Formal Verification), Institute of Software, Chinese Academy of Sciences Sep 2018 – Aug 2021

- Developed **DEEPSYMBOL (SAS2019)**, a **verification** tool for the robustness of **deep neural networks (DNNs)**.
 - Proposed a novel **symbolic-propagation** method improving **abstract interpretation** for **DNN analysis**.
 - Resolved issues in open-source projects, e.g., memory leak in **Zonotope** of **APRON** numerical abstract domain library that prevented scaling, caused by an ABI mismatch leading to memory layout and calling convention errors.
 - Bring benefits of up to **549%** speedup (9.16h \rightarrow 1.41h) to a state-of-the-art **SMT**-based **verifier**.

Technologies

Languages and Frameworks: Rust, OCaml, C++ , LLVM, Python, Java, PyTorch, Pyro, JAX, Rocq, Coq, Lean 4, Agda.

Skills: Compiler Construction, Type System, Program Analysis, Program Optimization, Formal Verification.

Thesis: Design and Implement Probabilistic Programming Languages for Sound and Scalable Inference.

Compilers	Venues	Inference Methods	Compilation Artifacts	Keywords
GENI[1]	ICFP'25	Knowledge Compilation	Probability Generating Functions	Compiler Optimization
MAPPL[2]	PLDI'24	Variable Elimination	CPS-Transformed Factor Functions	Program Partitioning
FIDELIO[3]	POPL'23	Variational Inference	Neural-Aided Guide Program	Absolute Continuity

Awards

- Competitive programming:
 - 2015: Silver Medal, **ACM-ICPC** Shanghai Metropolitan Programming Contest
 - 2014: Silver Medal, **ACM-ICPC** Asia Regional Contest, Anshan Site
- Scholarships:
 - 2023: David R. Cheriton Graduate Scholarship (awarded to **5 recipients**)
 - 2021: University of Waterloo Entrance Scholarship
 - 2020, 2014: China National Scholarship (**Top 0.2%**)
 - 2020, 2019: Institute of Software, CAS First-Class Academic Scholarships (**Top 10%**)

Services

- Subreviewer**: LICS 2018, TASE 2019, FM 2019, FMAC 2019, TACAS 2021, PLDI 2024, OOPSLA 2024.
- Student Volunteer**: CONCUR 2018, SSFM 2018, SSFM 2019, LICS 2020.
